Dear Mr Laifman

**SUBJECT: SUNBEAM ALPINE SERIES V, 1967, REMOTE SERVO**

Thank you for your letter on the above subject.

The vehicle was originally fitted with a Girling servo, part number 64049126. AP Lockheed's recommendation as an equivalent to this servo is part number LE10117.

We hope this is of assistance to you.

Yours sincerely

*fitting instructions for*

# **Remote Vacuum Servo Units Types 6, 7, 8 & 6 $\frac{7}{8}$**

**(For single line braking systems)**

A range of Servo Installation Kits and Servo Units, with Boost ratios to suit cars and light vans are detailed below. Specific applications and interchangeability with obsolete Girling versions are listed on page 6.

For vehicles not listed, advice on models not shown, or Technical assistance on installation or overhaul, please contact AP Lockheed Service Technical Department.

## Installation kits and servos

The following extra parts are available if required.

Description	Part No.	Description	Part No.
'L' bracket (servo shell stud mounting)	109548	Vacuum Hose clip 11/16" (17.5mm dia)	105827
'P' bracket (servo hydraulic cylinder mounting)	110590	Hydraulic Pipe clip (for bulkhead mounting)	3846-239
In Line non-return valve	4315-069	Adaptor (for manifold)	
Low pressure hose	9201-2400 24" (619mm) long	1/8" B.S.P. taper	3554-220
Vacuum hose	9201-4800 48" (1220mm) long	5/8 x 16 Whitworth	3554-219
Alternative Plastic air control valve cap	3887-266	5/8 x 18 U.N.F.	70742

## GENERAL FITTING INSTRUCTIONS

**TO ENSURE CORRECT INSTALLATION OF THE LOCKHEED REMOTE VACUUM SERVO UNIT, THOROUGHLY READ AND ADHERE TO THE FOLLOWING FITTING INSTRUCTIONS PRIOR TO CARRYING OUT ANY WORK ON THE VEHICLE.**

### Introduction

The vacuum servo unit is incorporated into the hydraulic braking system, remote from the master cylinder, as an intermediate stage operating between the master cylinder and the brake assemblies. The two main parts of the servo unit are the vacuum servo mechanism and the hydraulic slave cylinder assembly. These are bolted together so that the slave cylinder piston is in line with, and is operated directly by, the servo push rod.

A plastic non-return valve is fitted into the vacuum shell, and an integral air cleaner is incorporated to prevent foreign matter entering the air control valve chamber.

The servo unit is designed to give no assistance with very light brake application. In the absence of servo assistance due to loss of vacuum, an unrestricted passage for the fluid will exist. The brakes can still be applied, therefore, by the normal action of the pedal on the brake master cylinder, but this would demand heavier foot pressure to achieve the same degree of braking as with servo assistance. When this servo unit is used to replace a non **Lockheed** servo or is installed on a vehicle previously without a servo the following installation recommendations **must** be observed.

### Note:

**Not for use on vehicles with tandem or dual line braking systems except for specific applications where twin servo units are fitted. In this instance units must be replaced in pairs to maintain the correct brake balance.**

### Important:

Fitting a brake servo unit will not make faulty brakes reliable. Any fault in the vehicle braking system **must**

**Note:**

- A. When changing brake parts the need for absolute cleanliness is essential. Therefore ensure that hands are free of grease and dirt. Always use fluff-free cloth or paper towelling for cleaning purposes.
- B. Ensure a sufficient quantity of **Lockheed Universal brake fluid** is available for bleeding the braking system and topping up the reservoir. Where possible brake fluid should always be stored and dispensed from the original tin or bottle. Care must be taken to prevent both dirt entry and contamination especially in the mouth area of the master cylinder reservoir during this operation. **N.B. AP Lockheed do not recommend the use of silicone fluid in any Lockheed products.**

Prior to the fitment of the brake servo unit or the removal of an existing servo installation thoroughly clean the outer surfaces of the unit (where applicable) and around **all** relevant hydraulic pipe connections using methylated spirit as a solvent. **Do not use petrol or paraffin.**

On the majority of vehicles a 3-way adaptor is used into which are coupled the supply pipe from the master cylinder outlet port and the pipes feeding both front and rear brake assemblies.

**Removing existing installation**

- 1. Disconnect the battery.
- 2. Disconnect and remove the vacuum hose pipe that connects the servo unit to the vacuum pump / manifold.
- 3. Disconnect, remove and discard the hydraulic feed pipe from the master cylinder outlet port to the 3-way adaptor. Seal off the hydraulic connection points to prevent loss of brake fluid and ingress of foreign matter.
- 4. Unbolt the existing servo unit together with any mounting brackets, where applicable, and remove from the vehicle.

**Note:**

Brake fluid is injurious to paintwork. When removing the servo unit from the vehicle care should be taken to ensure no fluid is spilt onto the painted surface of the bodywork.

The following general instructions for the **Lockheed** remote servo installation kits are supplemented by recommendations on servo applications for popular vehicles. Obviously all vehicle types cannot be quoted, but by observing these instructions the kit can be used for the majority with single line braking systems.

Where the hydraulic piping, supplied in the fitting kit needs to be shortened it will be necessary to use a Bundy flaring tool to reform the pipe end.

**Fig.1 Fitment of air control valve extension hose**

## Location of new servo unit and brackets

1. It is essential that the servo unit is fitted to the integral body or chassis (i.e. **not to the engine**) thus preventing the brake pipes being subjected to vibration or flexing.
- 2a. It is an advantage to locate the servo within the engine compartment whenever possible to safeguard the unit and to keep the hydraulic pipe runs to a minimum length.
- 2b. Should it become necessary to fit the servo unit in an area on the vehicle prone to dirt, grit or water ingress e.g. under body wings, it is recommended that an extension hose be fitted to the air control valve inlet by carrying out the following modification, prior to installation.

### Method:

Carefully prise off the plastic air filter cover. Note components retained by the cover, which is a snap fit, may become dislodged on removal. Therefore care must be taken to prevent parts becoming lost or damaged. Extract the foam washer from within the existing cover and replace inside the alternative cover, **part no. 3887-266** supplied separately. Fit the new cover to the air control valve first ensuring that the rubber seal, seal retaining cap, compression spring and filter element are all correctly located. **(See Fig.1 for details)**. Connect one of the vacuum hoses from the kit to the inlet pipe on the filter cover, secure with clip provided. On installation, locate the other end of the vacuum hose in a suitable position away from dirt or grit.

3. Ensure the hydraulic slave cylinder is at least six inches away from any part of the vehicle exhaust system, otherwise fluid vaporisation from local heat could occur.
4. The servo unit need not be mounted below the level of the brake fluid reservoir, but keep the difference in height to a minimum.
5. With the aid of the mounting brackets and fixings provided in the kit install the servo unit with the hydraulic slave cylinder outlet port **inclined upwards between 25° and 45° from the horizontal plane**. **(See Fig.2)**. The air control valve should be situated **at least 30° below the centre line** to assist when bleeding the hydraulic system. **(See Fig.3)**.

Fig.2

**Fig.3**

### Fitting hydraulic piping

With **all** relevant connection points clean and free from ingress of foreign matter, using the new Bundy piping supplied in the kit:

- a. Connect up the feed pipe from the brake master cylinder to the servo slave cylinder inlet port.
- b. Connect up the supply pipe from the servo slave cylinder outlet port to the 3-way adaptor.

When bending brake pipes to shape, great care must be taken to avoid kinking. The best way to obtain a good curve is to bend the pipes smoothly round a mandrel of suitable diameter. Using existing clips on the vehicle, ensure pipes are properly secured and cannot chafe or foul other components. Where a long length of piping is fitted e.g. from one side of the vehicle to the other via the bulkhead, secure the pipe to the bulkhead to avoid vibration. Additional pipe clips are available for use where necessary. On some vehicles where space is limited, it will be helpful to use banjo and bolt fittings in the tapings of the servo slave cylinder to avoid a severe bend in the brake pipe. **(See Fig.4).**

#### Note:

No attempt should be made to cut and reflare existing brake pipes in situ, as problems could arise with contamination through ingress of foreign matter i.e. swarf.

### Vacuum hose, inline non-return valve and fittings

The servo unit must be connected via a vacuum hose, running from the plastic non-return valve located in the servo shell to a suitable vacuum source e.g. the engine induction manifold or vacuum pump. On some vehicles the manifold is already tapped and fitted with a removable plug, otherwise it will be necessary to drill and tap the manifold.

Three manifold adaptors are available, each with a different thread size to suit various applications.

These thread sizes are:-

1. **1/8" B.S.P. taper.** This is self-sealing and should be used when the manifold is not already tapped. Drill the top wall of the manifold 5/16" and tap with a 1/8" B.S.P. taper tap. The manifold should be removed from the engine for this operation.
2. **5/8" x 16 whitworth thread.** (Use with copper gasket supplied).
3. **5/8" x 18 U.N.F. thread.** (Use with copper gasket supplied).

In a convenient position, preferably at the highest point in the vacuum hose run, an inline non-return valve must be fitted. Cut the hose and connect up the two sections to the valve unit, secure with hose clips supplied. Ensure that when fitted the arrow on the non-return valve is pointing towards the servo. (See Fig.4).

To protect the servo unit and non-return valve from fuel contamination, especially on a petrol engine vehicle, a 'U' trap must be formed in the vacuum hose route.

It is essential the vacuum hose inclines downwards from the servo and that the 'U' trap is formed below the level of the servo and the inline non-return valve, i.e. by looping it between the inlet manifold and non-return valve so that point 'X' is lower than points 'Y' and 'Z' as shown (see Fig.4). Where the vacuum hose traverses the engine secure it with plastic ties. Secure hose connection at the servo with the remaining hose clip.

### Bleeding and testing system

1. Reconnect the battery.
2. Using new **Lockheed Universal brake fluid** or fluid as recommended by the vehicle manufacturer (**conforming to SAE J1703 specification**) bleed the braking system in accordance with the appropriate vehicle manufacturer's workshop manual. With the system properly bled, firm resistance should be felt at the brake pedal. If difficulty is experienced in achieving a "good bleed", then the bleeding process will be assisted by "cracking open" the brake pipe tube nut at the servo outlet connection whilst depressing the brake pedal. Surround this connection with clean cloth to capture escaping brake fluid. When the pedal is fully depressed retighten tube nut, repeat this process several times if necessary. When completed, "top up" the fluid reservoir to the correct level.
3. Start the engine and apply the brakes several times. Whilst an assistant depresses the brake pedal, re-check for fluid leaks particularly where new connections have been made. Road test the vehicle, and finally check again for fluid leaks.
